=====
Baldwin & Whitney

1842 ~ 1846

With the coming of Baldwin & Whitney, a locomotive classification system was initiated. It was fairly simple and straight forward

- 1 Pair of coupled drivers was classed "B"
- 2 Pair of coupled drivers were classed "C"
- 3 Pairs of coupled drivers were classed "D"
- 4 Pairs of coupled drivers were classed "E"

The designator "A" was reserved for a high speed single driver locomotive which Baldwin did not construct

The number preceding the coupled wheel designators indicated the gross weight of the locomotive in tons

This classification system did not take into consideration lead or trailing trucks; this came about, along with other changes, when the new Baldwin classification system was initiated in 1873

=====

Baldwin - Burnham, Parry, Williams & Co.

1873 ~

With the advent of "Baldwin, Burnham Williams Co", a new locomotive classification system went into effect. The prior system was, under the best circumstances, haphazard with many blanks. Plus, they were far from descriptive of the locomotives being built. This sufficed early on when there were only 1 or 2 varieties, but as production became more varied, a new class designation was initiated

It should be noted that there are some locomotives shown as Baldwin, Burnham Williams do not have the "new" BLW class designations. There are no definitive records as to which locomotives were assigned the new class system, but the listing shows the best that can be ascertained. The BLW "Class Listings" begin between 3/1873 to 5/1873, so it is reasonable to presume that the "new" class was not yet being used in January 1873 and February 1873. This is undoubtedly due to the fact that these locomotive orders were on the "books" prior to the implementation of the new system

As shown above, the First locomotive to receive this designator was a small 2-4-4 built for Brazil
